

Science rules on climate change

I read the article about global warming written by Richey Kemmling (Nov. 13) and I was shocked that it could get published.

This person does not know much about science and even less about climate change. Every single statement he made was a misinterpretation of scientific results. His conclusion was an outrageous one that not a single scientist would make.

The letters to the editor published the following day gave an idea to the reader that

Richey was not knowledgeable enough to write such an article. However, I really feel that it is not enough.

This subject is at the center of a lot of political discussion these days, and people should get the concrete facts. (They will not get them from King-TV).

Next time a journalist wants to write an article about a scientific subject, please have him or her call an expert. We have plenty of them at UW.
